

# Particle Control

## The Fast, Easy Way to Reduce Polishing

Like90 Particle Control is a water-based floor coating that controls dust and dirt circulating in the paint booth on the floor, keeping it out of your paint work. Applied with a standard pump sprayer, Particle Control is the fastest, easiest ways a shop can improve quality and profitability, by reducing the polishing needed to correct defects.

Particle Control works in two ways. First, when a dust particle lands on the floor, Particle Control neutralizes its electrical charge so that it stops repelling other particles. This allows them to clump together. Second, dust particles mechanically lock on to the active ingredients in Particle Control like flies sticking to fly paper. The combined processes transform dust and other particles into “heavy dirt” that is easy to sweep up with a broom without putting it back into circulation.

### Ideal for Shops Using Water-borne Paint Systems

The best way to reduce dry time is to increase air flow in the spray booth using fans, air nozzles, air jets and other accelerators. However, this increased air movement typically stirs up contaminants from the floor and other areas in the booth that tend to collect dust and dirt, as well as from the car being painted. As a result, the paint film is contaminated and requires polishing to achieve an acceptable finish. Like90 Particle Control is the ideal solution for shops that have converted to water-borne systems controlling the dust problems that from this increased air flow.

Feature:	Benefits:
<i>Turns dust into “heavy dirt”</i>	Traps airborne dust on the floor resulting in cleaner paintwork. Makes it faster and easier to sweep booth out for the next job.
<i>Long-lasting formula</i>	Need to apply just twice a day. Even once a day application makes a significant difference.
<i>Water-based, low VOC</i>	Non-hazardous, environmentally friendly formula.
<i>Eliminates need to wash out booths with water</i>	Helps prevent corrosion and minimizes unwanted humidity in the paint booth.
<i>Breaks up existing overspray</i>	Helps restore floor and grates to original condition and prevents future buildup.
<i>Ideal for shops with water-borne paint systems</i>	Controls contamination that results when air flow in the booth is increased to speed dry times.
